TITLE: A method for sealing glass to metal Class 32, No. 169220

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 6, 1965, 53

TOPIC TAGS: metal seal, glass to metal seal

ABSTRACT: This Author's Certificate introduces a method for sealing glass to metal by using a high frequency alternating current. A good connection is provided and oxidation at the glass-to-metal seal is prevented by connecting one pole of the hf generator to the body of the metal part with the glass pressed into it; and the other pole to the electrode which is to be sealed.

TITLE: Portable Record Player (Portativnyy proigryvatel')

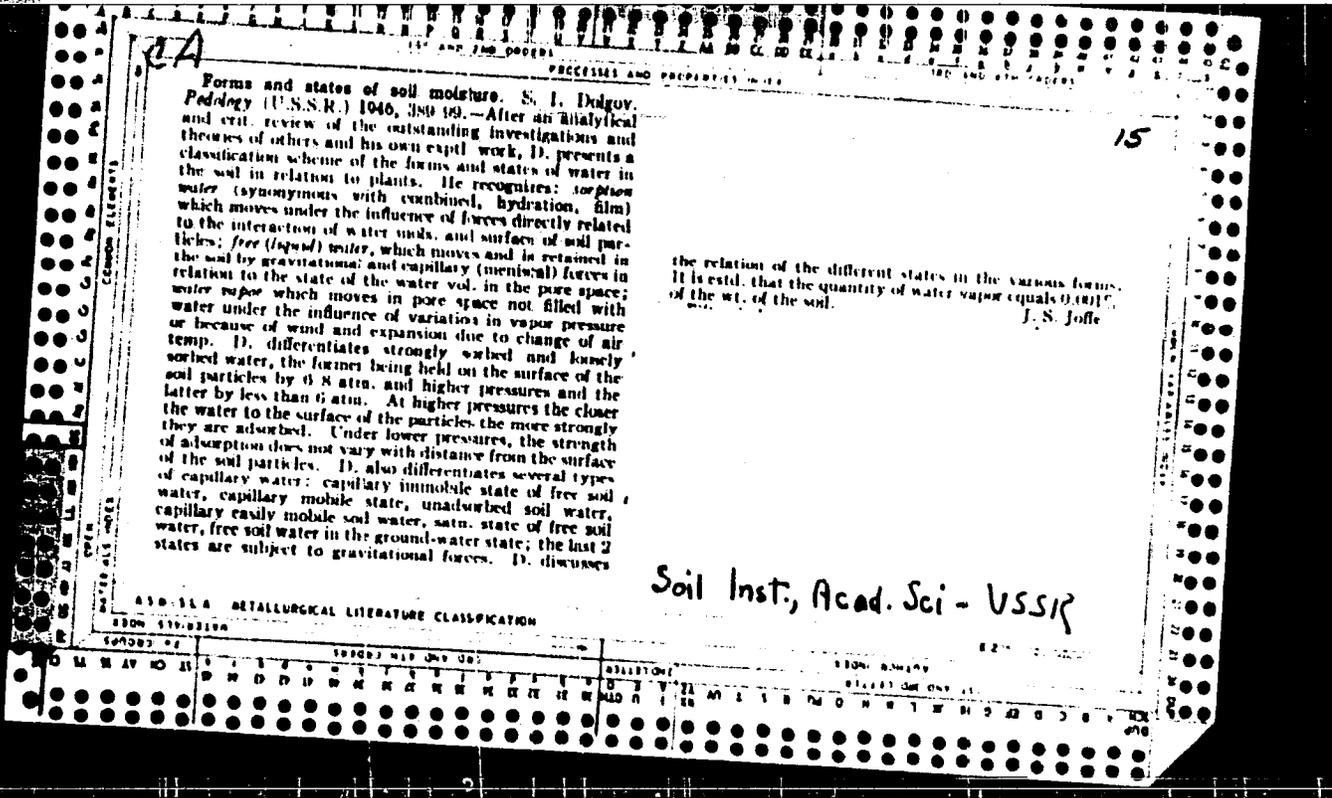

PERIODICAL: Radio, 1958, Nr 5, pp 31 - 32 (USSR)

ABSTRACT: The article contains a description of a portable record player which may be assembled by inexperienced radio amateurs. The amplifier consists of one double triode "6N2P" and the output tube "6P14P", four "DG-Ts27" diodes and one or two "1-GD9" loudspeakers. The sound pick-up "ZPU-1" and the two-speed electric motor "DAG-1" or any other similar sound pick-up or motor may be used. The circuit diagram of the amplifier is shown in figure 1. The amplifier may also be used for receiving radio broadcasts if a crystal receiver is added. In some cases it might be necessary to add an HF stage, consisting of a pentode "6K3", "6Zh1P" and others. The article further contains assembling instructions for this record player. There are four figures.

The conductivity method of determining the salinity of soils and ground waters. S. I. Dolgov and A. A. Zhitkova. *Pochвоведение* (U.S.S.R.) No. 7, 66-77 (1952).—To establish the relation between elec. cond. and salt concn. of soil-water exts., the specific conductance was detd. on 62 water exts. of various salinized-decalcified soils on which the salt content was detd. by the standard chem. methods. From the data obtained a conversion coeff. was established for 12 grades of salt concn. This coeff. is calcul. by dividing the concn. of the water ext. (g.-equiv. ions per l.) by the sp. conductance. Thus, by multiplying the figure on sp. conductance of any soil-water ext. or ground water by the coeff. one can read from the chart of the 12 grades the salt concn. expressed in g.-equiv. It is shown that for soils up to 10% concn. of salts the agreement with standard analyses is very good. The aspects of various salts and temp. effects are discussed. S. S. Joffe

Title : The Distribution of Agricultural Methods Over the Territory of the USSR.

Orig Pub : Zemleaslye, 1956, No 10, 19-27

Abstract : A group of workers of the institutes of the Academy of Sciences of USSR, commissioned by Gosplan, ^{The State Planning Committee} of the Council of Ministers USSR has accomplished the task of dividing the territory of USSR into natural-economic districts for the purpose of the rational distribution of agricultural production. Based on the agricultural soil map of the provinces, prepared in the process of this work, the author together with N.N. Rozov - has marked 25 important agricultural provinces on the territory of USSR, where agriculture is well developed. Brief soil-climatic and agricultural characteristics of each province are given. Enclosed are schematic maps of the agricultural soil and farming provinces.

Abs Jour: Ref Zhur-Biol., No 21, 1958, 95697.

Abstract: upper limit of this moisture is soil moisture to resist withering. 3. Available moisture but of low productivity. The upper limit is soil moisture which inhibits plant's growth. 4. Normally-available and normally-productive moisture for plants, assuring normal growth and development of plants. The upper limit is the least moisture capacity of soils (LM). 5. Moisture easily available for plants, assuring luxurious plant growth. The upper limit differs for various plants, but commonly lies near that saturation of water by the soil in which close to 15% of the soil volume is air. 6. Excess, but easily-available moisture. Owing to difficult gaseous exchange, the air supply of the soil microorganisms and roots of the

Abstract: plants is difficult. With such a moisture content, only plants with air conducting tissue can develop. Volume of LM limits the readily active condition of soil moisture, which assures luxurious growth of the vegetative mass of the plants, to a less active condition, which assures only normal growth and development. Soil tests show that with the soil moisture below LM the activity of the moisture decreases; the character of the soil moisture and its salt composition changes. With moisture below LM, the exchange reactions between the NaCl and the carbonates of the soil proceed more intensively, formation of soda occurs more intensively, Cl is absorbed. With moisture above LM, these reactions proceed very slowly. The

Abs Jour: Ref Zhur-Biol., No 21, 1958, 95697.

Abstract: effect of fertilizers can be positive or negative depending on the moisture of the soils. Basic criterion of soil moisture is volume of LM. The degree of soil moisture during crop cultivation must not fall below the moisture point which inhibits plant growth (70% LM) and must not exceed harmful saturation of water by the soils. The air residue must not be below 15-20% of the soil volume. Bib. 20 titles. -- N. G. Minashina.

Ye. B. Ivanova, Professor, and V. A. Mosin, Candidate of Sciences,
Ed. of Publishing House: V. Ye. Markov; Tech. Ed.: I. P. Kus'ala.

FOURPAGE: This book is intended for students and practitioners of
soil science and land utilization. It will also be of interest
to geographers and cartographers engaged in soil surveying and
mapping projects.

COVERAGE: This work on soil surveying was prepared by a group of
scientists of the Department of Soil Geography and Cartography
of the Pochvennyy Institut AN SSSR (Soil Institute, AS USSR).
The book discusses the methods used in both general and special-
purpose surveys. The basic aim of all operations is to raise
agricultural productivity and introduce widespread utilization.
The book includes representative maps and maps of the forms
and reports to be used by the soil scientist. No personalities
are mentioned. There are 46 Soviet references.

TITLE:

A Copying-Grinding Machine for Machining Turbine
Blades of Varying Profile

PERIODICAL:

Energomashinostroyeniye, 1961, No. 3, pp. 32-34

TEXT:

The most complicated operation in blade manufacture is grinding the blade profile. Until recently, at the Leningradskiy metallicheskiy zavod (Leningrad Metal Works) and other turbine manufacturers this operation has been carried out manually. The work is heavy and the metal is annealed locally because the pressure applied to the grinding wheel is uneven. In recent years many attempts have been made to mechanize the operation. After prolonged experimental and development work, the Leningrad Metal Works (LMZ) has developed two machines for grinding large turbine blades of variable profile. One of these machines was designed by the Leningrad Branch of VPTI (Designer M. A. Borukhzon) the other was developed at the LMZ; both give good and stable results. Deviations permitted from the theoretical profile do not exceed

A Copying-Grinding Machine for Machining Turbine Blades of Varying Profile

0.1-0.15 mm. The copying and grinding machine designed by the Leningrad branch of VPTI is based on mechanical copying of a model. The main feed of model and blank is provided through a special drive and distribution mechanism and the profiling feed is derived from the pressure of the model on a copying roller. The grinding is performed in transverse strokes and transition from one stroke to the next occurs on the overrun. Outline drawings of the machine are given in Fig. 1 and a detailed description of the mechanism is given. The copying roller 10 bears on the model 11 which operates on the grinding wheel 3 cutting the blank 2. The special drive 17 is provided for trimming the grinding wheel with an industrial diamond. The principles of operation are described. The method of grinding blades is illustrated in Fig. 2 the initial position of the blade and grinding wheel is shown in Fig. 2a. Blade section 1-2 is ground by rotating it round an axis, as point 2 is reached the cam mechanism arrests rotation and starts displacing the table so that the section 2-3 is ground. The feed

E194/E235

A Copying-Grinding Machine for Machining Turbine Blades of Varying Profile

is maintained constant to ensure evenness of finish by appropriate profiling of the cam. The cam is displaced relative to the blade whilst on the overrun section 3-4. Blades up to 780 mm long can be ground, the maximum diameter of the grinding wheel is 400 mm and the least diameter 320 mm. The number of double strokes of the operating table per minute is 7.5-45, the grinding wheel runs at a speed of 1440 r.p.m. and the overall dimensions of the machine, length, width and height are 2670 x 2140 x 2800 mm. A defect of the machine is that the grinding wheel wears during the process of grinding and this causes some error in the blade profile. The machine developed by the LMZ is then described, it is a special machine Type 1C-96 (1S-96) of the "Stankonstruktziya" Works which was modernized and made into a semi-automatic copying machine for grinding the backs of variable profile blades. The modernization consisted in reconstructing the polishing head and developing a device for turning the blade and model, in providing an oil cooling system and other minor reconstructions. An outline drawing

S/114/61/000/003/002/002
E194/E235

A Copying-Grinding Machine for Machining Turbine Blades of Varying Profile

of the machine is given in Fig. 3 and the construction is briefly described. It can deal with blades up to 760 mm long at a cutting speed of 25 m/sec, the table being displaced at a rate of 3250 mm/min. This machine has an abrasive belt which can make a cut up to 1 mm deep. The feed is controlled by a copying roller acting on the model. The amount of cross-feed depends on the shape of the blade and ranges from 1.5 to 4 mm. The pressure of the belt on the model is constant at 10 kg, the working part of the belt is 25 mm wide. The machine time for grinding a blade is 15-20 minutes depending upon the length and shape. A copious supply of cooling oil is provided during the grinding operation. The abrasive belts have a linen base with white electro-corundum of No. 46 grain size. The accuracy of the finished profile is within 0.1 mm over the length of the blade. This method of grinding has a number of advantages, it is very accurate, a good class 7 finish is obtained. The metal that is left on the blades after milling, 0.5-1 mm is removed in a single operation. The main difficulties with the

A Copying-Grinding Machine for Machining Turbine Blades of Varying Profile

machine are inadequate stability of the grinding belts, and the high consumption of oil which must be frequently replaced because of contamination with cuttings and abrasives. Cooling with emulsion type lubricants is required and water resistant belts are needed. However, the use of automatic grinding has reduced the manufacturing costs and improved turbine efficiency. A full range of grinding machines for turbine blades should be developed. There are 3 figures and 3 tables.

TITLE: Studying the stressed state of machine tool frame members by the photoelastic method

26

SOURCE: Stanki i instrument, no. 7, 1966, 19-21

TOPIC TAGS: photoelasticity, stress analysis, machine tool

ABSTRACT: The authors use the optical method for studying the stressed state of roll-turning lathe beds. This method can also be used for studying the overall stressed state of such a machine. This method makes it possible to determine experimentally the isoclinic parameter and main tangential stresses at a given point in the two-dimensional model of a cross section of the frame and to evaluate normal stresses on unloaded contours. "Stress division" is used to determine normal stresses at points lying within the cross section contour with respect to the isoclinic parameter and the main stress differences. This method is very useful for the experimental determination and selection of the optimum shape for the cross section of the bed. Orig. art. has: 3 figures.

automatic evaluation of EKG elements and for signal indication of deviations from selected EKG elements of examined EKG's with respect to normal EKG's. A model for analysis of the temporary relationships of EKG elements contains systems for identification of examined EKG intervals, comparison of the examined intervals with selected normal intervals, and signal indication during deviations of the values to be compared which exceed established values. A model for analysis of amplitude relationships of EKG elements includes systems for identification and amplitude comparison (with normal waves) of examined EKG waves, and systems for signal indication during deviations of the values to be compared which exceed established values. A model for signal indication of a deviation of the examined EKG elements from the established values and for reduction of the probability of an incorrect result consists of systems of coincidence, systems with different storage capacity, and a signal indicator. A device for automatic commutation of leads and establishment of a certain number of examined EKG cycles on each lead has systems for output of synchronized pulses, a counter of synchronized pulses, and a pitch selector. Abstract : The experiments were conducted on horses. A 1%
solution of atropine sulfate (1) was administe-
red subcutaneously in doses of 0.5 to 10ml. When
a dose of 0.5 ml of 1 was administered the maxi-
mal blood pressure (BP) rose by 7-17 mm on the
mercury column, the minimal pressure by 5 to 7
mm, the P-Q section of the electrocardiogram

Card 1/2

USSR/Pharmacology. Toxicology. Cholinergic Drugs V

Abs Jour : Ref Zhur-Biol., No 8, 1958, 37558

Abstract : diminished by 0.05 seconds, the QR increased by 0.03 seconds, and the pulse rate increased from 32 to 40 pulsations. The administration of 1 ml of 1 produced a rise in the maximal BP by 8 to 12 mm on the mercury column, the minimal BP dropped by 9 to 17 mm, the PQ section on the electrocardiogram diminished by 0.08 seconds, the QR by 0.02 seconds, while the pulse rate did not change. After the administration of 1 in doses of 3 ml the maximal BP rose by 13 to 31 mm, the minimal by 20 to 30 mm, the PQ of the electrocardiogram was accelerated by 0.18 seconds, the RS by 0.12 seconds, and the pulse rate increased from 30 to 73 pulsations. It was noted that the effect of 1 is manifested stronger in animals with a dominant sympathetic nervous system.

TITLE: Hydrodynamic instability in boiling-water reactors

SOURCE: Teplotenergetika, no. 1, 1965 51-55

TOPIC TAGS: boiling water reactor, uranium graphite reactor, heat transfer, hydrodynamic stability, flow pulsation, reactor cooling

ABSTRACT: Experiments were conducted in order to establish the conditions for hydrodynamic stability in a boiling-water uranium-graphite reactor. Two series of tests were made using a reactor fuel-element assembly mockup consisting of four electrically heated, water-cooled tubes (220 mm long with a 9 mm ID). In the first series of tests, at a given constant pressure, water flow rate and heat flux in the tube section, the water inlet temperature was gradually increased (at intervals) until flow pulsation occurred. In the second series of tests, the use of throttle plates of 5.00--2.65 mm ID for pulsation damping was investigated. The results show that other conditions being equal, reduction in heat flux, increase in pressure, and increase in

Card 1/2

L 32034-65

ACCESSION NR: AP5006298

mass velocity result in increased stability. At pressures of 13.2×10^4 , 15.6×10^4 , and 17.45×10^4 n/m², flow pulsation occurred only at combinations of small inlet velocities and high heat fluxes. The pulsation originated at a low inlet velocity by weight steam content at the pressures. The water-steam mixture of 0.1-0.2 was used. The throttle plate of 0.6 mm ID produced stable flow under regulated conditions. The results are applicable to boiling-water reactors with a core height of as much as 2-2.5 m. It is possible that reactors with higher cores will be subject to flow pulsations under similar conditions. Orig. art. has 3 figures and 2 tables.

Изв. Москва, 1976.

Мл. И.И. Шаповалов; Ed. of Publishing House: O.M. Kuznetsov; Tech. Ed.
Pavel Kuznetsov, 1976.

PURPOSE: This collection of articles is intended for metallurgical engineers,
physicists, and workers in the machine-building and radio-engineering industries.
It may also be used by students of schools of higher education.

COVERAGE: The collection contains technical papers which were presented and dis-
cussed at the First All-Union Conference on Rare-Metal Alloys, held in the in-
stitute of Metallurgy, Academy of Sciences USSR in November 1977. Results of
investigations of rare-metal alloys, titanium, and copper-base alloys with ad-
ditions of rare metals are presented and discussed along with investigations of
zirconium, vanadium, niobium, and their alloys. The effect of rare-earth metals
on properties of magnesium alloys and steels is analyzed. The uses of rhodium
as a dehydrating catalyst, electrical material, and catalyst suitable for
making plugs for vacuum tubes and electrical systems are discussed. Also, the ef-
fect of the addition of certain elements on the properties of heat-resistant
steels is analyzed and alloys with special physical properties (particularly
superconductive alloys) are discussed. Biographical notes on personalities who
and non-Soviet references accompany some of the articles.

TITLE:

Investigation of the Starting Conditions of an ¹⁹Atomic
Power Station With a Uranium Graphite Reactor Working
With Superheated Steam ¹⁹

PERIODICAL: Atomnaya energiya, 1960, Vol. 9, No. 1, pp. 10-15

TEXT: In a specially adapted steam-to-water loop of the first Soviet nuclear power station, the investigation mentioned in the title was carried out by three methods, where the steam was generated in the reactor of the power station. The heat engineering parameters were measured by means of the arrangement shown in Fig. 1. The analysis of the methods applied must satisfy the following requirements: (a) The method applied at the start must permit a rapid rise from zero to the rated power. (b) Under the transient conditions the maximum temperature of the fuel elements must not exceed the temperature which the fuel elements have at

Card 1/3

Graphite Reactor Working With Superheated Steam

the rated power. (c) Under the transient conditions, it must be possible for the temperature of the fuel elements to be continuously increased. (d) The method applied at the start must require minimum operation of the technological equipment. In the first method, the transient is characterized by the following: (a) The temperature of the fuel elements can be increased by 100 - 150°C in a minute. (b) The transition to superheating does not take place simultaneously in the various channels of the steam-to-water loop. (c) In the secondary cycle, a marked change of pressure takes place, which necessitates an intensive blowing of this loop. During the transient the second method produces a definite cooling of the channels in which the steam is generated. Thus, the whole transition takes place with a minimum of reactor power. With the third method it is possible to prevent an upward temperature jump by lowering the reactor power from the moment of transition to superheating conditions. The abrupt fall of temperature is shortened by a smaller reduction of the reactor power and the blowing through of the channels in which the steam is generated. All results are graphically represented.
